Python Tutorial: if __name__ == '__main__'

Video

https://youtu.be/sugvnHA7ElY?si=q3yM5FbeAPmFNm40

Notes

- When you run a module directly, its __name__ will be __main__

- When Python runs a file, it starts by setting a few special variables

  - Such as __name__

- If you import a module, then that imported module's __name__ will be the name of the module (the filename)
